Value Functions and Bellman Equations

LATEST SUBMISSION GRADE

100%

1 / 1 point

1. A function which maps ___ to ___ is a value function. [Select all that apply]

- Values to actions.
 States to expected returns.

✓ Correct

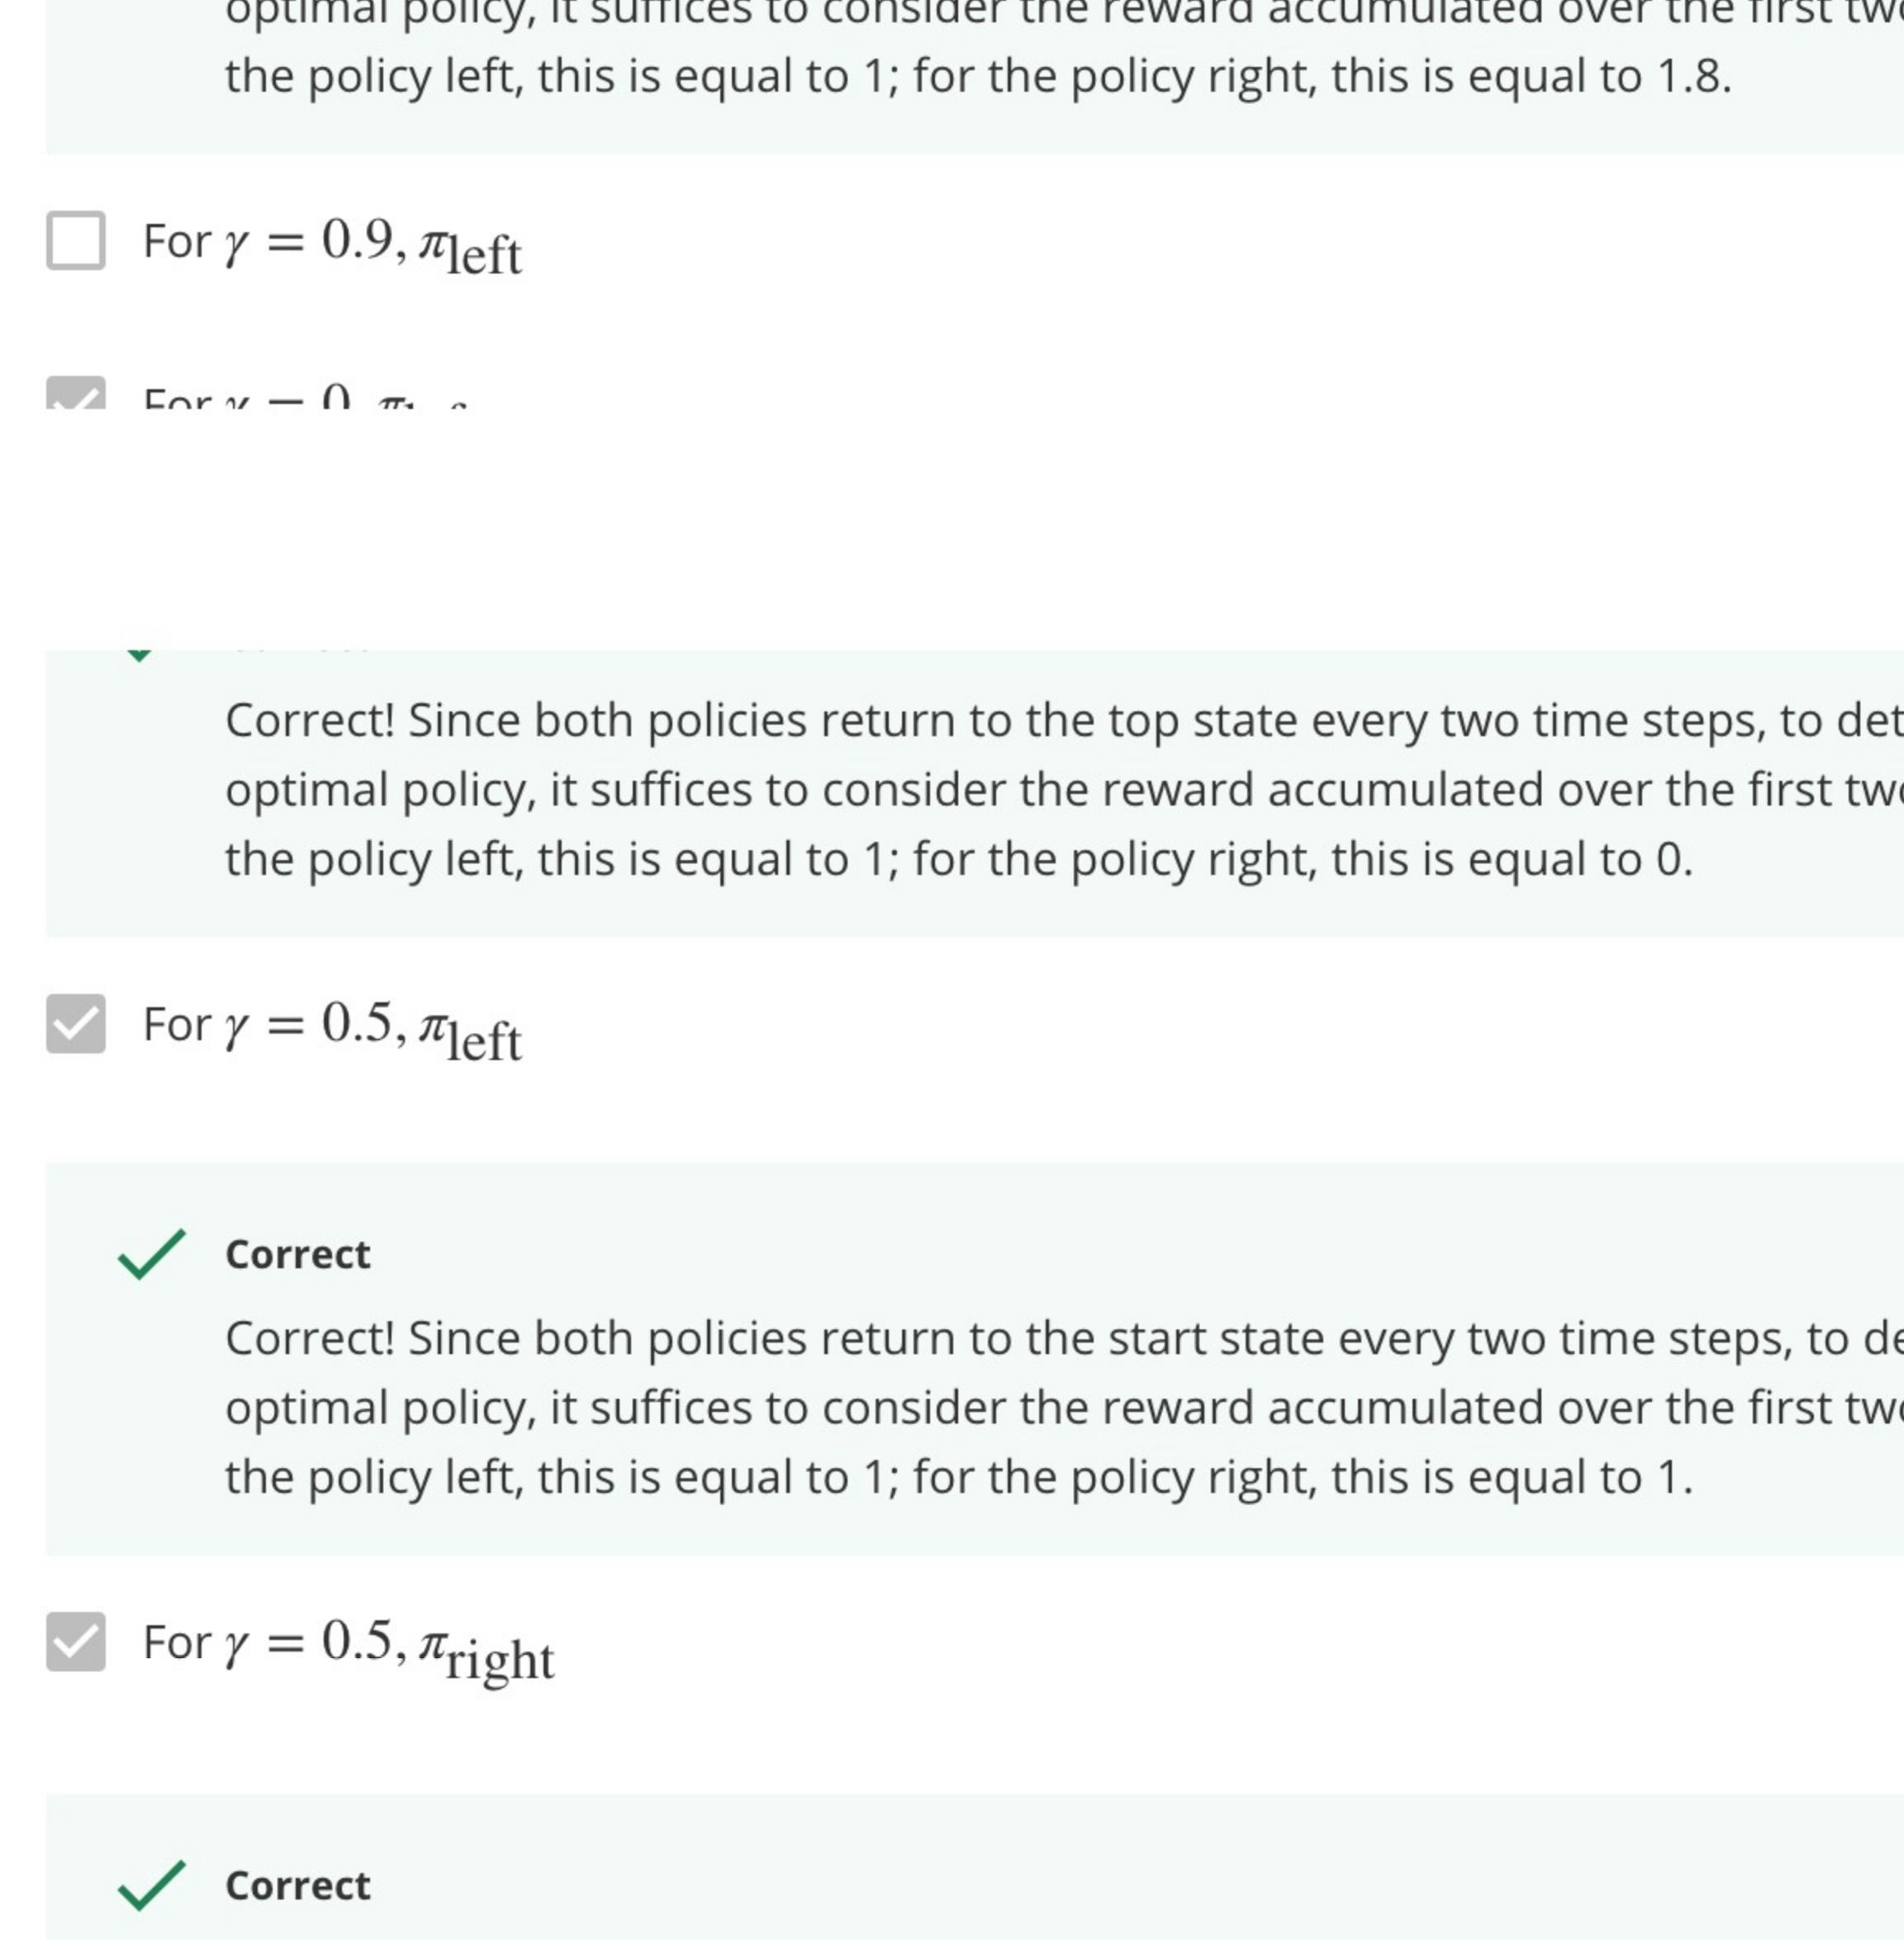

Correct! A function that takes a state and outputs an expected return is a value function.

- Values to states.
 State-action pairs to expected returns.

✓ Correct

Correct! A function that takes a state-action pair and outputs an expected return is a value function.

and π_{right} . Indicate the optimal policies if $\gamma = 0$? If $\gamma = 0.9$? If $\gamma = 0.5$? [Select all that apply]

- For $\gamma = 0.9, \pi_{\text{right}}$

✓ Correct

Correct! Since both policies return to the top state every two time steps, to determine the optimal policy, it suffices to consider the reward accumulated over the first two time steps. For the policy left, this is equal to 1; for the policy right, this is equal to 1.8.

- For $\gamma = 0.9, \pi_{\text{left}}$

- For $\gamma = 0, \pi_{\text{right}}$

✓ Correct

Correct! Since both policies return to the start state every two time steps, to determine the optimal policy, it suffices to consider the reward accumulated over the first two time steps. For the policy left, this is equal to 1; for the policy right, this is equal to 0.

- For $\gamma = 0.5, \pi_{\text{left}}$

✓ Correct

Correct! Since both policies return to the start state every two time steps, to determine the optimal policy, it suffices to consider the reward accumulated over the first two time steps. For the policy left, this is equal to 1; for the policy right, this is equal to 1.

- For $\gamma = 0, \pi_{\text{right}}$

3. Every finite Markov decision process has ... [Select all that apply]

1 / 1 point

- A unique optimal value function

✓ Correct

Correct! The Bellman optimality equation is actually a system of equations, one for each state, so if there are N states, then there are N equations in N unknowns. If the dynamics of the environment are known, then in principle one can solve this system of equations for the optimal

- A stochastic optimal policy

- A deterministic optimal policy

✓ Correct

Correct! Let's say there is a policy π_1 which does well in some states, while policy π_2 does well in others. We could combine these policies into a third policy π_3 , which always chooses actions according to whichever of policy π_1 and π_2 has the highest value in the current state. π_3 will necessarily have a value greater than or equal to both π_1 and π_2 in every state! So we will never have a situation where doing well in one state requires sacrificing value in another. Because of this, there always exists some policy which is best in every state. This is of course only an informal argument, but there is in fact a rigorous proof showing that there must always exist at least one optimal deterministic policy.

- A unique optimal policy

4. The ___ of the reward for each state-action pair, the dynamics function p , and the policy π is ___ to characterize the value function v_π . (Remember that the value of a policy π at state s is $v_\pi(s) = \sum_a \pi(a|s) \sum_{s',r} p(s'|r|s,a)[r + \gamma v_\pi(s')]$)

1 / 1 point

- Distribution; necessary

- Mean; sufficient

✓ Correct

Correct! If we have the expected reward for each state-action pair, we can compute the expected return under any policy.

5. The Bellman equation for a given policy π : [Select all that apply]

1 / 1 point

✓ Correct

Correct!

- Expresses the improved policy in terms of the existing policy.

- Holds when the policy is greedy with respect to the value function.

6. An optimal policy:

1 / 1 point

- Is unique in every finite Markov decision process.

- Is not guaranteed to be unique, even in finite Markov decision processes.

- Is unique in every Markov decision process.

✓ Correct

Correct! For example, imagine a Markov decision process with one state and two actions. If both actions receive the same reward, then any policy is an optimal policy.

7. The Bellman optimality equation for v_π : [Select all that apply]

1 / 1 point

✓ Correct

Correct!

- Expresses the improved policy in terms of the existing policy.

- Expresses state values $v_\pi(s)$ in terms of state values of successor states.

✓ Correct

Correct!

- Holds when $v_\pi = v_\pi$ for a given policy π .

8. Give an equation for v_π in terms of q_π and π .

1 / 1 point

- $v_\pi(s) = \sum_a \pi(a|s) q_\pi(s, a)$

- $v_\pi(s) = \max_a \pi(a|s) q_\pi(s, a)$

- $v_\pi(s) = \max_a \gamma \pi(a|s) q_\pi(s, a)$

- $v_\pi(s) = \sum_a \pi(a|s) q_\pi(s, a)$

✓ Correct

Correct!

- $q_\pi(s, a) = \max_{s',r} p(s'|r|s,a)[r + \gamma v_\pi(s')]$

- $q_\pi(s, a) = \max_{s',r} p(s',r|s,a)[r + v_\pi(s')]$

- $q_\pi(s, a) = \max_{s',r} p(s',r|s,a)[r + \gamma v_\pi(s')]$

- $q_\pi(s, a) = \sum_{s',r} p(s'|r|s,a)v_\pi(s')$

- $q_\pi(s, a) = \sum_{s',r} p(s',r|s,a)\pi(s'|r|s,a)v_\pi(s')$

✓ Correct

Correct!

- $q_\pi(s, a) = r(s, a) + \gamma \sum_{s',r} p(s'|r|s,a)v_\pi(s')$

✓ Correct

Correct!

- $q_\pi(s, a) = r(s, a) + \gamma \sum_{s',r} p(s',r|s,a)\max_{s'} q_\pi(s', a')$

✓ Correct

Correct!

- $q_\pi(s, a) = r(s, a) + \gamma \sum_{s',r} p(s'|r|s,a)\pi(s'|r|s,a)q_\pi(s', a')$

✓ Correct

Correct!

9. Consider an episodic MDP with one state and two actions (left and right). The left action has stochastic reward 1 with probability p and 3 with probability $1 - p$. The right action has stochastic reward 0 with probability q and 10 with probability $1 - q$. What relationship between p and q makes the actions equally optimal?

1 / 1 point

- $7 + 3p = -10q$

- $7 + 2p = 10q$

- $13 + 2p = -10q$

- $7 + 3p = 10q$

- $13 + 2p = -10q$

- $7 + 2p = -10q$

- $13 + 3p = 10q$

✓ Correct

Correct!
